Explore this article by Mike Bostock titled '**Across U.S. Companies, Tax Rates Vary Greatly**' from The New York Times, and consider the questions below.

Consider the following questions/ideas:

- Variation of corporate tax.
- What types of companies pay less tax and high tax?
- Why some companies pay less tax than others?
- Any interesting discoveries.

My Answer:

Looking closely at the Data from above from the New York Times, it is incredibly interesting to see how much corporate tax rates change from within different industries. While insurance companies pay the most tax at a 51% effective tax rate between 2007 -2012. Utilities companies paid the least tax at 12%. This huge gap can occur due to tax codes, and how it handles the industries completely different. Utility companies get a huge write of for building physical infrastructure and investing in equipment which then helps lower their tax bills. Whereas other business and asset heavy sectors like insurance don't get those kinds of loopholes. Even though the official tax rate is set at 35% during those years, different companies can pay very different amounts in the real world based entirely on their business model.
